< LEVEL UP YOUR DEFENSE SKILLS />

TEAM FORTRESS

MANN CO. is recruiting!

Their *Digital Forensics & Incident Response* Manager needs to strengthen the **Breach Lockdown Unit** team with skilled Security Analysts who can handle attacks from the **Rogue Exploitation & Demolition** team.

True to MANN CO.'s philosophy of **"We sell products and get in fights."** they don't just interview candidates, they test them under fire! That is why you're given some access to their training infrastructure where you will compete against other promising applicants for a coveted position on the *DFIR* team.

To prove your worth, you'll face three realistic scenarios. Your objective is to investigate each one, document your findings with precision, and deliver a comprehensive DFIR report that demonstrates both your technical capabilities and professional methodology.

1. **Network Traffic Analysis:**

Scrutinize some packet captures to identify potential malicious activity, C2 channels, and data exfiltration attempts.

2. **Memory Forensics:**

Inspect a compromised system's memory dump to uncover hidden processes, injected code, and attacker persistence mechanisms.

3. **Malware Reverse Engineering:**

Dissect a malicious binary to understand its capabilities, identify indicators of compromise, and determine its behavior.

The links for each scenario will be provided directly on your LMS platform (and likely via Teams).

Expectations & Deliverables

Complete all three scenarios before the deadline. Each lab requires:

- ✓ Full investigation of provided evidence;
- ✓ Identification of all indicators of compromise (IoCs);
- ✓ Clear documentation of attack techniques and timeline;
- ✓ Extraction of actionable intelligence.

Submit a comprehensive report that follows industry standards and respects the provided template.

They expect a PDF file, professionally formatted, with table of contents.

Besides your technical expertise, the company will also assess some of your soft skills, such as:

- ✓ **Rigor:** Thoroughness, completeness, and attention to detail;
- ✓ **Methodology:** Structured and repeatable investigation approach;
- ✓ **Accuracy:** Clear and unambiguous technical writing;
- ✓ **Documentation:** Proper evidence handling and reporting standards;
- ✓ **Communication:** Effective presentation for both technical and executive audiences.

The best candidates don't just find the answers: they communicate them clearly, document their methodology rigorously, and provide actionable intelligence.

Good luck, Analyst.
